

## Letter of Declaration

The World Health Organization (WHO) classifies variant viruses as variants of concern (VOC) and variants of interest (VOI). At present, **Delta(B.1.617.2)** and **the newly identified Omicron (B.1.1.529)** is the VOC mutant strain that has the greatest impact on the epidemic and the greatest threat to the world.

A number of studies on the Delta(B.1.617.2) and Omicron(B.1.1.529) have shown that a number of mutations occur on the Spike protein (especially the RBD region). The mutation increases the affinity between the SARS-CoV-2 coronavirus and the ACE2 receptor on the surface of the host cell, which can cause the virus to be more infectious, and ultimately increase the infectivity between people. But these mutations will not affect the detection ability of antigen test kits targeting N protein (Nucleocapsid, nuclear protein).

We, Gensure Biotech Inc., hereby declare that,

Our product GenSure™ COVID-19 Antigen Rapid Test Kit detects the Nucleocapsid protein (N protein) of the SARS-CoV-2 coronavirus, so the test results of GenSure™ COVID-19 Antigen Rapid Test Kit will not be affected by the Delta and Omicron variants.
